                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to a method for producing ethanol from starch-containing material, by fermentation. The method involves carrying out a secondary liquefaction step in the presence of a thermostrable acid alphamylase. The method is used in producing ethanol from a starch-containing material such as tubers, roots or whole grain (e.g. corn, wheat or barley or their combination) or combination of the materials. Preferably ethanol is produced from starch-containing meterial that is obtained from cereals or from corns, cobs, wheat, barley, rye, milo and potatoes or their combination. The ethanol produced by above mentioned method is used as fuel alcohol and/or fuel additive. The ethanol is also useful as drinking ethanol i.e., potable neutral spirits or industrial ethanol. The present sequence is Aspergillus niger alpha-amylase protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Producing ethanol from starch-containing material e.g., tubers, roots, whole grain, for use in fuel, by fermentation comprises carrying out a secondary liquefaction step in the presence of a thermostable acid alpha-

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to a method for the production of an alcohol product by holding a slurry of water and granular starch in the presence of an acid alpha-amylase and a glucoamylase at 0-20 deg C below the initial gelatinization temperature of the granular starch, holding the slurry in the presence of acid alpha-amylase, glucoamylase and yeast at 10-35 deg C to produce ethanol; and optionally recovering the ethanol. The method is used for the production of an alcohol product such as beer or recovered ethanol, e.g. fuel ethanol, potable ethanol or industrial ethanol. This sequence represents an acid fungal alpha-amylase from Aspergillus niger used in the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Production of alcohol product, e.g. beer, comprises holding slurry of water and granular starch in presence of acid alpha-amylase and glucoamylase followed by simultaneous saccharification and fermentation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps

The sequences given in ABBB0164-87 show enzymatic proteins derived from A. funigatus. These proteins display the catalytic activity of an enzyme cuch as tennase, cellulase, glucose oxidase, glucoamylase, phytase, betagalactosidases, invertase, lipase, alpha-amylase, laccase, polygalactucnosnae or xylanase. Compositions comprising the tannase are useful for modulating the amount of cellulase in a composition and composition comprising cellulase are useful for modulating the amount of cellulase in a composition comprising glucose oxidase are useful for modulating the amount of cellulase are useful for modulating the amount of success or oxygen in a composition. Composition comprising betagase are useful for modulating the amount of laccose or oxygen in a composition. Composition comprising sucrase or invertase are useful for modulating the amount of laccose in a composition. Composition composit particularly an instant tea product. The polypeptide having cellulase activity enhances cleaning ability of detergent compositions Sequence 630 AA;

The peptides AAR84928-R85063 and AAR85786-R85842 are peptides derived from the WD40 regions of a range of proteins (AAR85851-R85893) containing WD40 (also called beta-transducin) amino acid repeat regions. The WD40 regions are involved in protein-protein interactions between proteins involved in intracellular signalling. An example of such an interaction is between protein kinase C and receptors of activated protein kinase (RACK), esp. RACK-I (AAR85850). The proteins were isolated based on homology with beta-transducin or with its WD-40 consensus sequence. The peptides can be used to identify target proteins contg. WD-40 motifs, as modulators of enzyme esp. isozyme, activity of proteins involved in protein-protein interaction and to screen for drugs that will affect protein-protein interaction involving WD-40 domains. This peptide is derived from the repeat II from the TUPI protein
                                                                                                                                                                                                                                                          WD40 repeat region; beta-transducin; protein-protein interaction; drug; intracellular signalling; protein kinase C; homology; motif; modulator; receptors of activated protein kinase; enzyme activity; isozyme; human.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New WD-40 (beta-transducin)-derived polypeptide(s) - which alter the activity of a protein, eg. protein kinase C, which interacts with a protein contg. a WD-40 region.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps

A; Title: Cloning and nucleotide sequence of the genomic Taka-amylase A gene of Aspergill
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               C; Punction:
A; Description: catalyzes the hydrolysis of internal 1,4-alpha-D-glucosidic bonds
A; Description: catalyzes the hydrolysis of internal 1,4-alpha-D-glucosidic bonds
A; Pathway: glycogen/starch degradation
C; Superfamily: Aspergillus alpha-amylase; alpha-amylase core homology
C; Keywords: glycoprotein; glycosidase; hydrolase; polysaccharide degradation
C; Keywords: glycoprotein; glycosidase; hydrolase; signal sequence #status predicted <NGT>
F; 22,499/Product: alpha-amylase fartus predicted <NMT>
F; 21,499/Domain: alpha-amylase core homology <AMY>

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                        1612378

Royer T.J., Thompson S.A., Ward M., Wilson L.J., Berka R.M.; "Cloning, characterization, and expression of two alpha-amylase genes from Aspergillus niger var. awamori.";

Curr. Genet. 17:203-212(1990).
-!- CATALYTIC ACTIVITY: Endohydrolysis of 1,4-alpha-glucosidic
linkages in Oligosaccharides and polysaccharides.
-!- COFACTOR: Binds 2 calcium is per subunit. Calcium is inhibitory
at high concentrations (By similarity).
-!- SIMILARITY: Belongs to the glycosyl hydrolase 13 family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            HISSP, P10529; 777A.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

"Cloning, characterization, and expression of two alpha-amylase genes from Aspergillus niger var. awamori.";
Curr. Genet. 17:203-212(1990).
-!- CATALYTIC ACTIVITY: Endohydrolysis of 1,4-alpha-glucosidic
linkages in Oligosaccharides and polysaccharides.
-!- COFACTOR: Binds 2 calcium ions per subunit. Calcium is inhibitory at high concentrations (By similarity).
-!- SIMILARITY: Belongs to the glycosyl hydrolase 13 family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    SMART; SM00642; Aamy; 1.

It is produced through a collaboration between the Swiss Institute of Bioinformatics and the EMBL outstation the European Bioinformatics Institute. There are no restrictions on its use by non-profit institutions as long as its content is in no way modified and this statement is not removed. Usage by and for commercial entities requires a license agreement (See http://www.isb-sib.ch/amnounce/or send an email to license@isb-sib.ch)
-1- COFACTOR: Binds 2 calcium ions per subunit. Calcium is inhibitory at high concentrations.
-1- SUBUNIT: Monomer.
-1- SIQUENTI: Monomer.
-1- BIOTECHNOLOGY: Used in the brewing industry to increase the fermentability of beer worts (including those made from unmalted cereals), in the starch industry to make high maltose and high DE syrups (starch saccharification), in the alcohol industry to reduce fermentation time, in the cereal food industry for Flour supplementation and improvement of chilled and frozen dough, and in the forestry industry for low-temperature modification of starch. Sold under the name Fungamyl by Novozymes.
-1- MISCELLANEOUS: The sequence of AMY1 and AMY2 is shown.
-1- SIMILARITY: Belongs to the glycosyl hydrolase 13 family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             SWART; SM00642; Aamy; 1.

-!- CATALYTIC ACTIVITY: Endohydrolysis of 1,4-alpha-glucosidic
Linkages in Oligosaccharides and polysaccharides.
-!- COFACTOR: Binds 2 calcium ions per subunit. Calcium is inhibitory at high concentrations (By similarity).
-!- SUBCELLUAR LOCATION: Secreted.
-!- SIMILARITY: Belongs to the glycosyl hydrolase 13 family.
-!- SIMILARITY: Contains 1 carbohydrate binding type-21 (CBM21)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Sequence 43, Sequence 10, Sequence 7, Al Sequence 7, Al Sequence 7, Al Sequence 10,

Thermus sp. IM6501; maltogenic amylase; EC 3.2.1.133; crystallisation; protein co-ordinate data; 3 dimensional structure. Aspergillus oryzae TAKA protein (TAA). ABB09072 standard; protein; 423 AA. 99KR-00039130 99KR-00039130 (SAMY-) SAMYANG GENEX CORP. (first entry) (POST-) POSTECH FOUND WPI; 2001-534477/59. Aspergillus oryzae. Park GH; KR2001027418-A. 26-JUN-2002 09-SEP-1999; 09-SEP-1999; 06-APR-2001. ABB09072; Kim TJ, RESULT 1 ABB09072 

Manufacturing maltogenic amylase having improved transglycosylation activity, comprises using crystallization.

Disclosure; Page 188; 196pp; Korean.

3.2.1.133) having improved transmistance of matching arguments and any analysis having improved transmission activity, comprising using crystallisation and the three dimensional structure of maltogenic amylase comprises the following steps: (i) obtaining a gene of maltogenic amylase from Thermus sp. 1M6501 (KCTC 5027BP) and inserting the gene into plasmid pUC119 to construct recombinant DNA (pThMA119); (ii) inserting the recombinant DNA to Bscherichia coli MC1061, which is cultivated at 37 plus degrees Celsius for 10 hours in Luxia-Bertani (LB) media and centrifuging the media to obtain a microbial cell; (iii) suspending the microbial cell with buffer supernatant through column chromatography and obtaining purified maltogenic amylase is a dimer comprised of two The present invention describes manufacturing maltogenic amylase (BC

maltogenic amylase molecules, and a Thermus sp. IM6501 maltogenic amylase (TMAA) crystal. The amylase has a structure contenting an activated region that consists of amino acid residues of Asp-338, Glu-357, Asp-424, and a pocket with glucose bound that consists of amino acid residues of Pro44, TY145, Arg91, Arg91, Bro118, Cys116, Asn131, Glu1332, Va11329, and His1360. The present sequence represents Aspergillus oryzae TAKA protein (TAA), given in comparison with ThMA in the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The sequence os that of the Asoergillus oryzae alpha amylase, sold commercially as FUNGAMYL (TM) by Novo Nordisk A/S. The sequence can be mutated by substitution of one or more of its methionine residues for any amino acid other than cysteine. The mutant alpha-amylase exhibits a better activity level and better stability in the presence of oxidising agents than previous mutant alpha amylases, and improved thermostability at moderately low ph. The enzyme can be used as an additive for detergents, dishwashing agents and liquifaction agents. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Mutant alpha-amylase from Bacillus species comprising a methionine substitution - with improved stability and activity at low pH, for use in detergents, dishwashing agents and liquefaction agents.
                                                                                                                                       Gaps

The enzymes have one or more amino acid residues added, deleted or substituted. The variants can also be used for textile desizing prior to scouring, bleaching and dyeing. The variants have improved thermostability, acid/alkaline stability; low temperature optimum; higher hydrolysis velocity and improved tolerance to other composition constituents, e.g. oxidation agents. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps

                                                                                                                                                                                                                                                                           This sequence represents the mature form of taka-amylase from A. oryzae. This sequence was used in a method for the generation of mutant pullulanases for use in the food industry (see also AAR79026-28). The wild type pullulanase enzyme was modified by the method of the invention for enhancing the hydrophobicity of a selected site of the pullulanase. The method comprises replacement of a group in the selected site with a hydrophobic group, replacement of an amino acid with a hydrophobic amino acid, and/or insertion or deletion of a hydrophobic amino acid, and or deletion of a hydrophobic amino acid, selected site. The method was used to produce neopullulanases Y377F,
                                                                                                                                                                              Modifying a transferase by enhancing hydrophobicity of a selected site increases transfer activity, also new mutant neo-pullulanase(s).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    alpha-amylase; mature; Bacillus licheniformis; termamyl; fungamyl; Aspergillus oryzae; Bacillus amyloliquefaciens; altered property; calcium dependency; substrate binding; stability; pH optimum; thermostability; cleavage; oligosaccharide substrate; dishwashing; washing; detergent additive; fabric desizing; starch liquefaction; sweetener; ethanol production; variant.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Length 478;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Oxidation stable alpha amylases can be used for the simultaneous desizing
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    and bleaching or scouring of a fabric comprising starch or starch derivatives. They exhibit a better heat stability, especially in the presence of oxidising agents. They are obtained from a parent alpha amylase by replacing one or more methionine residues with any amino acid different from Cys or Met, preferably Leu, Thr, Ala, Gly, Ser, Ile or App. The parent alpha amylase is pref. derived from a Bacillus species, although alpha amylases of fungal origin can also be used. This sequence is the wild type (unmodified) alpha amylase of Aspergillus oryzae
          Alpha amylase; oxidation; desizing; bleaching; scouring; fabric; starch; thermostable; methionine; Bacillus licheniformis; Bacillus amyloliquefaciens; Bacillus stearothermophilus; Aspergillus oryzae.
                                                                                                                                                                                                                                                                                                                                                                                                                                                simultaneous desizing and or starch derivs.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Wild type; neopullulanase; B. stearothermophilus; mutant; food industry; modification; hydrophobicity; replacement insertion; deletion.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present sequence is the mature Aspergillus oryzae alpha-amylase (A). Variants of parent termamyl- and fungamyl-like alpha-amylases (and methods of constructing them) are claimed. Examples of variants are featured above. The variants have altered properties such as calcium dependency, substrate binding and stability. Also one or more proline or cysteine residues in the variant is modified or replaced with a non-proline or non-cystein residue such as alanine. The variants can be used for (dish)washing, as detergent additives or for fabric desizing or starch liquefaction. They can also be used for the production of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Alpha-amylase variants and methods of production - have altered properties such as calcium dependency, substrate binding and stability.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 maltose;
a variant) corresponding to 325-345 of AAW14498 is deleted or replaced with a fragment corresponding t fragment; claim 38"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Fungamyl-like alpha-amylase; glucoamylase; dextrinisation; maltalcohol; starch; dough improver; brewing; starch liquification.

```
The present sequence represents a fungamyl-like alpha-amylase. The specification describes variants of this fungamyl-like alpha-amylase, which have an alteration in one the amino acid regions 90-110, 150-160, 161-167, 280-280, 448-455, and 468-475. Each alteration is a deletion or substitution of an amino acid or an insertion of an amino acid downstream of a particular position. The variants retain alpha-amylase activity, and have better heat stability and/or stability at acidic pH, relative to wild-type enzyme. The variants can therefore be used at higher reduced need for cooling and reduced risk of contamination). The variants may also be used in conjunction with other enzymes, particularly of high maltose content, or alcohol, from starch; as syrups, particularly of high maltose content, or alcohol, from starch; as dough improved for bled goods; in brewing, to increase fermentability of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Producing heterologous biological substance comprises culturing mutant of wild-type Aspergillus niger strain in medium suitable for producing heterologous biological substance and recovering heterologous biological
                                             New variant of Fungamyl-like alpha-amylase, useful for production of malcose syrups, includes mutations that improve stability against heat and acidic pH.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Producing heterologous biological substance comprises culturing mutant of wild-type Aspergillus niger strain in medium suitable for producing heterologous biological substance and recovering heterologous biological
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present invention relates to a method of producing heterologous biological substance. The method involves culturing mutant of wild-type Aspergillus niger strain in medium suitable for producing heterologous biological substance, where mutant strain comprises first nucleotide sequence encoding heterologous biological substance and second nucleotide heterologous biological substance of glucoamylase (glad) and recovering heterologous biological substance. The present sequence is the Aspergillus niger neutral alpha-amylase B (amyB) protein.
The present invention relates to a method of producing heterologous biological substance. The method involves culturing mutant of wild-type Aspergillus niger strain in medium suitable for producing heterologous biological substance, where mutant strain comprises first nucleotide sequence encoding heterologous biological substance and second nucleotide sequences comprising modification of glucoamylase (glax) and recovering heterologous biological substance. Its present sequence is the

                                                                                                                                                                                                                                                                                                                                                                                02-MAY-2002.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Telford J,
Tettelin H;
                                                                     ABP28341;
                           The present invention describes polynucleotides which encode processing enzymes (e.g. alpha-amylase, pullulanase, alpha-glucosidase, glucose isomerase, or glucoamylase) that are optimised for expression in plants. The polynucleotides encode mesophilic, thermophilic or hyperthermophilic processing enzymes, which are activated under suitable conditions to act upon the desired substrate. Also described are self-processing transgenic plants and plant parts, e.g. grain, which express one or more of these enzymes and have an altered composition that facilitates plant and grain processing. Also described is a method (M) for converting starch to starch-derived products in a transformed plant part (TPP), by activating the starch processing enzyme contained in it. Transgenic grain is useful or produce food products having improved taste and to produce fermentable substrates for ethanol and fermented beverages. (M) eliminates the need to mill or physically disrupt the integrity of plant parts prior to recovery of starch-derived products. The present sequence represents alpha-amylase/glucoamylase fusion protein, which is given in the example integrity of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Novel polynucleotide encoding hyperthermophilic processing enzymes e.g. alpha-amylase, useful for producing plant to produce food products having improved taste or fermentable substrates for ethanol.
                                                                                                                                                                                                                                                                                       Self-processing plant; plant; processing enzyme; alpha-amylase; grain; pullulanase; alpha-glucosidase; glucose isomerase; glucoamylase; mesophilic; thermophilic; hyperthermophilic; transgenic plant; starch; maltodextrin; ethanol; fermentation; beverage; enzyme.

The invention relates to a protein (ABP25413-ABP30895) from group B streptococcus/GAS (Streptococcus/GAS (Streptococcus/GAS (Streptococcus/GAS) gequences (S1), given in the specification. The proteins have antibacterial and antinflammatory the specification. The proteins have antibacterial and antinflammatory activity. (1), nucleic acids encoding (1), ABM6044-ABN71256 and antibodies that bind (1) are used in the manufacture of medicaments for the treatment or prevention of infection or disease caused by Nucleic acids encoding (1) are used to detect Streptococcus in a streptococcus bacteria, particularly S. agalactiae and S. pyrogenes.

Nucleic acids encoding (1) are used to detect Streptococcus in a biological sample. (1) is used to detect Streptococcus in a composition comprising (1) or a nucleic acid encoding (1), may be consed as a vaccine or diagnostic composition. The disease caused by Streptococcus that is prevented or treated may be meningitis. Nucleic acid encoding (1) may be used to recombinantly produce (1) and may be used in gene therapy. Antibodies to (1) are used for affinity chromatography, immunoassays, and distinguishing/identifying
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps

A thermostable alpha-amylase (AAR88212) of Thermomyces lanuginosus CBS 224.63 is expressed in Aspergillus niger hosts using a gene (AAT10562) stoolated from a T. lanuginosus gene library. The recombinant enzyme (54-60 kDa) shows optimal activity at 60-70 deg and pH 5.8-6, has a pI of 3.7 and is active at 60-80 deg. (Updated on 16-OCT-2003 to standardise OS
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Thermophilic alpha-amylase with activity range of 60-80 degrees C - derived from Thermomyces lanuginosus, useful in the prepn. of foodstuffs

                                                                                                                                                                                                                                                                                                                                                                                           ઠે
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present invention relates to novel plant transcription factor proteins (1) and nucleotide sequences (II) (ADD61534-AD063779). The proteins (I) and nucleotide sequences (II) (ADD61534-AD063779). The proteins (II) and nucleotide sequences (III) (ADD61534-AD063779). The sequences can be used to produce transgenic plant compared to a non-transgenic plant compared to an altered trait selected from increased tolerance to abiotic stress, increased tolerance to council in cold, increased tolerance to conditions, increased tolerance to cold, increased tolerance to low nitrogen conditions, increased tolerance to low nitrogen sensing, increased tolerance to low nitrogen conditions, increased tolerance to low nitrogen sensing, increased tolerance to seased tolerance to multiple fungal pathogens, increased testance to conditions, increased testance to conditions, increased testance to conditions, increased testance to suggers, altered carbon/nitrogen sensing, early flowering, latered carbon/nitrogen sensing, early flowering, altered flower structure, loss of thower determinacy altered sensitivity to ABA, reduced sensitivity to ABA, reduced sensitivity and altered flower structure, loss of thower determinacy altered send morphology, altered vascular tissue structure, reduced altered stem morphology, altered vascular tissue structure, reduced altered stem morphology, altered vascular tissue structure, reduced altered stem morphology, altered vascular tissue structure, reduced altered trichome structure, altered seed development, altered coll flower structure, altered seed development, altered seed development, altered coll proliferation, altered seed development, altered seed colloration, altered seed distance, altered seed development, altered seed ordoration, altered seed ordoration, altered seed colloration, altered seed ordoration, altered seed ordoration, altered seed ordorat
                                                                                                                                           Plant; transcription factor; transgenic plant; abiotic stress tolerance; semotic stress tolerance; cold tolerance; heat tolerance; low nitrogen tolerance; low hosphate tolerance; fungal disease; glyphosate resistance; flowering; fertility; seed development.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New recombinant polynucleotide encoding transcription factor polypeptides, useful for producing transgenic plants with advantageous properties compared to a reference plant.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Reuber TL;

                                                                                                                                                                                                                                                                                                                                                                                                                                               The present invention provides the protein and coding sequences of novel proteins from a variety of organisms, including human, dog, cat, horse, cow, pig, hamster, monkey, macaque, yeast, bacteria, fruit fly, sea urchin and tomator. These were derived from expressed sequence tags (ESTs) from the organism of interest. They can be used in diagnostics, forensics, gene mapping, identification of mutations, to assess biodiversity and for nutritional purposes. The present sequence is a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps

The invention relates to human polynucleotides (AAI79941-AAI93841) and the encoded proteins (AA000010-AA013910) that exhibit activity elating to cytokine, cell proliferation or cell differentiation or which may induce production of other cytokines in other cell populations. The polymetides and polypeptides are useful in gene therapy, vaccines or peptide therapy. The polypeptides have various cytokine-like activities, e.g. stem cell growth factor activity, nematopoiesis regulating activity, tissue growth factor activity, immunomodulatory activity and activin/inhibin activity and may be useful in the diagnosis and/or treatment of canoer, leukaemia, nervous system disorders, arthritis and inflammation. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

A,Description: catalyzes the hydrolysis of internal 1,4-alpha-D-glucosidic bonds
A;Pathway: glycogen/starch degradation
C;Superfamily: Aspergillus alpha-amylase; alpha-amylase core homology
C;Superfamily: Aspergillus alpha-amylase; alpha-amylase core homology
C;Keyvords: calcium; carbohydrate digestion; glycoprotein; glycosidase; hydrolase; poly.
F;1-21/Domain: signal sequence #status predicted <SIG>
F;22-499/Product: alpha-amylase 1 #status experimental <MAT>
F;194-321/Domain: alpha-amylase core homology <AMY>
